DEPARTMENT OF COMPUTER SCIENCE & ENGINEERING

## PROJECT EVALUATION

### PROJECT WORK:

- Generally, 2 to 4 students are permitted to form a project batch who is interested in carrying out a project of their interest.
- The Department Advisory Committee (DAC) consisting of HOD, Dean and senior faculties will monitor the progress of students through their allotted guides.
- Project progress is evaluated in three stages by faculty members for 10%, 30% and 60% of total CIE marks respectively.
- Levels of internal assessment: Synopsis, Midterm & Final evaluation.
- External assessment is based on the University examination evaluated by Internal & External examiners allotted by Controller of Examinations (Autonomous).
- CIE is considered for 40% of the total internal marks and SEE for 60% of total external marks to calculate attainments.

Review #	Agenda	Rubrics	Review Overall Assessment Weightage marks
Progress Evaluation-I	Project Synopsis/ Proposal Evaluation	Problem Statement, Literature Review	10
Progress Evaluation-II	Mid-Term Project Evaluation	Methodology and Design of Existing System and Feasibility of Project Proposal, Planning of Project Work and Team Structure	40
Progress Evaluation-III	Semester-End Project Evaluation	Demonstrate and Presentation of Project Work with Project Report	100

## ABSTRACT

In current trend many social networking sites created and providing services of communications, multi-media services, e-commerce etc immensely. For example twitter social media provide major services of micro-blogging massively, it has more than 700 million users and 400 million micro-blogs produces per day. According to research survey many more than 30% of dummy or duplicate or fake accounts are present in all social media services like twitter, facebook, sina etc. Crawling the user information from the user micro blogs is also less practical. Anonymous Users can easily manipulate the public profile information.

So in this project we are implementing the web based application which will find the anonymous users according to the user behavior. We calculate the user behavior according to the chat statements of the user which he/she do with others. By the taking the advantages Machine Learning algorithms we classify the anonymous users. Here we are using Naïve Bayes algorithm to perform the classification of the users.

The scope of our work will improve the security in online social network platform. We are pointing the loopholes of the current system and proposing new architecture to fulfill the loopholes. The scope of our work is to monitor the user behavior using chat history and provide some security features to the user.

# ABSTRACT

Dynamic Proof of Storage (PoS) is a useful cryptographic primitive that enables a user to check the integrity of outsourced files and to efficiently update the files in a cloud server. Although researchers have proposed many dynamic PoS schemes in singleuser environments, the problem in multi-user environments has not been investigated sufficiently.

A practical multi-user cloud storage system needs the secure client-side cross-user deduplication technique, which allows a user to skip the uploading process and obtain the ownership of the files immediately, when other owners of the same files have uploaded them to the cloud server. To the best of our knowledge, none of the existing dynamic PoSs can support this technique.

In this paper, we introduce the concept of deduplicatable dynamic proof of storage and propose an efficient construction called DeyPoS, to achieve dynamic PoS and secure cross-user deduplication, simultaneously. Considering the challenges of structure diversity and private tag generation, we exploit a novel tool called Homomorphic Authenticated Tree (HAT). We prove the security of our construction, and the theoretical analysis and experimental results show that our construction is efficient in practice.

## ABSTRACT

Mobile specific webpages differ significantly from their desktop counterparts in content, layout and functionality. Accordingly, existing techniques to detect malicious websites are unlikely to work for such webpages. In this, we present KAYO, a mechanism that distinguishes between malicious and benign mobile web pages. It is a fast and reliable static analysis technique to detect malicious mobile web-pages. KAYO uses static features of mobile webpages derived from their HTML and JavaScript content, URL and advanced mobile specific capabilities. First, we experimentally demonstrate the need for mobile specific techniques and then identify a range of new static features that highly correlate with mobile malicious webpages. Finally, we build a browser extension using KAYO to protect users from malicious mobile websites in real-time. In doing so, we provide the first static analysis technique to detect malicious mobile webpages.

# ABSTRACT

The world-wide web has become the most important information source for most of us. Unfortunately, there is no guarantee for the correctness of information on the web. Moreover, different web sites often provide conflicting information on a subject, such as different specifications for the same product. In this project a new problem called Veracity is proposed that is conformity to truth, which studies how to find true facts from a large amount of conflicting information on many subjects that is provided by various web sites. A general framework has been designed for the Veracity problem and invented an algorithm called Truth Finder, which utilizes the relationships between web sites and their information, i.e., a web site is trustworthy if it provides many pieces of true information, and a piece of information is likely to be true if it is provided by many trustworthy web sites. This Experiments show that Truth Finder successfully finds true facts among conflicting information, and identifies trustworthy web sites better than the popular search engines.
